Pangean Technologies announces the release of version 2.0 of its IP-based Public Address (PA) System

New York, N.Y. – June 7, 2006, Pangean Technologies, experts in instant communications for the enterprise market, today announced the release of *insta-RELAY!*[™] version 2.0, the latest version of its IP-based Public Address (PA) system.

Unlike traditional PA systems which use a hard-wired electronic amplifier, Pangean's IP-based PA solution uses an existing corporate network and clients installed on users' PC to rapidly disseminate corporate information to users via voice broadcast channels, with no need for additional hardware. The system can also integrate with other traditional PA systems and with one button click, a user can instantly speak to other users who are tuned in to that broadcast channel. The solution can also be used as a IP-based emergency broadcast system where emergency notifications need to be relayed to employees.

The new version of *insta-RELAY!* supports MySQL as well as Pangean's Multicast Reflector, a solution that allows unicast-only networks to receive multicast communications. This would enable multicast packets to go across corporate WAN links even if multicast is not enabled over the corporate WAN.

"We view Pangean's solutions as the mission-critical VoIP solutions for the enterprise market and *insta-RELAY!* 2.0 delivers on this concept of instant communications," said Jack Galligan, VP of Sales and Marketing at Pangean Technologies. "With the new MySQL and Reflector support, this version of *insta-RELAY!* will allow companies to leverage their converged networks to improve employee productivity and fundamental business communications processes."

insta-RELAY! takes an IP approach to PA systems using SIP. The system supports instant, full-duplex, and multi-channel communications on a one-to-many and many-to-many basis. Any employee with access to the corporate network, including remote users (VPN), can receive the audio broadcast on their PC.

About Pangean Technologies

Pangean Technologies develops and markets innovative, SIP-based VoIP software applications for efficient internal and campus-wide communications for the enterprise market. These cost-effective, open-system solutions leverage an organization's existing IP network by delivering converged communications services to each user's desktop.
